

SentryVMS 6.2.16.9 Release Notes

Improvements:

SentryVMS Desktop Client

- SentryVMS client clipped exports (.avi and .exe) now include camera name within the title of the file
- Users can now be assigned to groups while the users are being created, as opposed to adding them to groups later on.
- Pause and play of recordings are now controlled by singular pause/play button
- Facility Map and View lists are now in alphabetical order within the left pane
- Clips can be exported from multiple cameras for a particular time period in one operation
- Aspect ratio setting improvement: Normal/Stretch change applies to all cameras in view
- Clipping progress can now be cancelled from the "Downloads" page
- Map menu can now be searched by utilizing the magnifying glass within the left pane
- Ability to delete server connection from "Server Setup" page of thick client
- Camera name appears above image when camera is added to a custom view so user knows which camera was already added

SentryVMS Web Client

- High Speed mode requires Internet Explorer 8+. Non IE users will be notified via browser prompt about browser incompatibility.

SentryVMS Mobile Client

None noted. Use "Sentry VMS 2" for IOS and Android. Latest Android version is 3.0.1. Latest IOS version is 2.2.6.

Fixed Issues:

- Access View door controls are now functional for Isonas integration
- Audio alerts for rules are now functional
- Web browser within views no longer takes up $\frac{3}{4}$ of the page
- Maps can now be launched at startup. Go to Administration -> Options -> Startup -> Tools Launch on Startup
- New Sentry VMS GUI displays the active user in the upper left –just below the ribbon
- Camera name, as listed within workspace, changes when the camera is changed
- Active Directory login is now functional

- Executable file clip option now produces executable files
- Saved workspaces can now be deleted
- Imported server list (.lsl file) now sticks if the user switches to a different menu option and switches back. This can be completed within Administration -> Options -> Connections
- Disabling of live video now works on more than one workspace; it used to only affect the presently viewed workspace
- Attempting to go to an invalid time within the Recorded tab's "Go To Time" area now results in an error message
- Autodiscovery will no longer announce a search as being complete upon initialization if a prior search was cancelled
- Switching from blank camera setup page to dewarped 360 degree view no longer results in an unhandled exception
- Pausing video within a minimized menu no longer results in an unhandled exception
- Admin can no longer add a blank username to Users & Groups
- Loading a workspace that contains a map now works properly
- Scroll wheel zoom is now functional
- Camera error log is now functional for the default directory (C:/test)
- .exe file clipping function now works
- Choosing a NIC in autodiscovery no longer causes a crash
- Administration -> Servers -> Advanced no longer indicates "Save Now" when no changes have been made
- Clipping a .exe file from a multi-camera view can now save to multiple files when clipping is non-multiplex
- Camera side timestamp can now be disabled within the new GUI within the Camera Properties page
